Analysis: Hydrogen Cyanide
Preparation SOP: NMAM 6010 MOD
Analysis SOP: NMAM 6010 MOD

Client: Atmospheric Analysis & Consulting, Inc.
Matrix: Soda Lime Tubes
ALS Work Order ID(s): 1315667

General Set Information: Seven samples from this work order were analysed for hydrogen cyanide collected on soda lime.

Method Summary: The front and back sections from each soda lime tube are emptied into separate dram vials. The soda lime is desorbed in 20 mL of 0.25N NaOH for at least one hour with occasional agitation. Cyanide is reacted with Chloramine-T and a pyridine-barbituric acid solution in a phosphate buffer. The resulting species is quantitated by automated colorimetry at 570nm on a WestCo SmartChem (Instrument ID: WET01).

Sample Preparation: All samples were prepared in accordance with published procedures.

Hold Times: The hold times were met for both preparation and analysis.

Instrument Calibration Data: Instrument calibration was performed in accordance with published procedures. Calibration results are within control limits.

Initial and Continuing Calibration Data: Initial and continuing calibration verifications were performed in accordance with published procedures. All calibration verifications were within control limits. All calibration blank concentrations were less than the reporting limit.

Dilutions: None were required.

Method QC Data: The method blank concentration was less than the reporting limit. The LCS and LCSD results were within method control limits. The relative percent difference (RPD) between the LCS and LCSD was within control limits.

NC/CAR: None were required.

Flagging Codes: Refer to laboratory report.

Sample Calculation: The analysis instrument produces results in $\mu\text{g/L}$. The final results are calculated by the equation below. Results are reported to two significant figures on the sample report and three significant figures on the QC report.

Result for soda lime tubes: $(A) \times (B) \times (C) \times (D) = (\mu\text{g HCN/sample})$

A = Analyte concentration from the instrument determination ($\mu\text{g/L}$)

B = Conversion factor from $\mu\text{g CN}$ to $\mu\text{g HCN}$ (1.039)

C = Conversion factor from $\mu\text{g/L}$ to $\mu\text{g/sample}$

D = Dilution(s) performed before to prep and at time of analysis if any

Miscellaneous Comments: None.

Case Narrative

Analysis: Mercury on Sorbent Tubes

Client: Atmospheric Analysis &
Consulting, Inc.

Preparation SOP: NMAM 6009 MOD

Matrix: Hopcalite/Hydrar Sorbent Tubes

Analysis SOP: NMAM 6009 MOD

ALS Workorder ID: 1315667

General Set Information: Seven samples were analyzed for mercury on sorbent tubes.

Method Summary: Sorbent material is transferred into digestion vessels and dissolved in 5mL of a solution that is 50% concentrated nitric acid and 50% concentrated hydrochloric acid. The acid solution and dissolved sorbent material is diluted to 50mL final volume with ASTM Type II water. Digested samples are then analyzed using a CETAC M-7500 cold vapor mercury analyzer with a CETAC ASX-130 autosampler, utilizing stannous chloride as a reducing reagent.

Sample Preparation: All samples were prepared in accordance with published procedures.

Hold Time: All samples were prepared and analyzed within the appropriate hold time.

Instrument Calibration: Instrument calibration was performed at the range of 0.01 to 1.0 µg/sample utilizing solutions prepared at the same time and by the same process as the field samples and quality control samples. Calibration results are within acceptable criteria.

Initial and Continuing Calibration Verification Data: Initial and continuing calibration verifications were performed in accordance with published procedures. All calibration verifications were within control limits. All calibration blank concentrations were less than the reporting limit.

Method and Sample QC Data: The reagent blank and method blank concentrations were less than the reporting limit. The LCS and LCSD results were within control limits. The relative percent differences between the LCS and LCSD were within control limits.

Dilutions: No dilutions were required for this workorder.

Matrix Spike and Matrix Spike Duplicate Analysis: NA

Post-Digestion Spike analysis: NA.

NC/CAR: None were required.

Flagging Codes: Refer to the last page of the report for all applicable flagging codes.

Sample Calculation: The analysis instrument produces results in $\mu\text{g}/\text{sample}$. Reported results are calculated by the following equation; results are reported to two significant figures.

$$\text{mg of mercury per m}^3 = [(A)(B)(C)] / [(D)(E)]$$

A = Analyte concentration from instrument determination ($\mu\text{g}/\text{sample}$)

B = Dilution performed at time of analysis if applicable

C = Conversion factor: (1 mg/1000 μg)

D = Air volume per sample

E = Conversion factor: (1 m^3 /1000L) if air volume provided in L

$$\text{Example Calculation: } [(0.5\mu\text{g}/\text{sample})(1 \text{ mg}/1000\mu\text{g})] / [(500\text{L})(1 \text{ m}^3/1000\text{L})] = 0.001 \text{ mg}/\text{m}^3$$

- Note that because the conversion factors cancel mathematically the same result will be obtained by simply dividing the $\mu\text{g}/\text{sample}$ result by the sample air volume in L.

Miscellaneous Comments: None were required.

Matrix: Soda Lime Tubes
Analyst/Date: Mary Karanu 06/13/13
Analyte/Method: HCN /NIOSH 6010Mod
Batch/HBN ID: IWC: 1875 / 108318
Reporting Limit: (HCN) 0.21 µg/sample

SAMPLE PREPARATION/ANALYSIS: Front (F) and back (B) sections of each tube are added separately to dram vials. 20mL of 0.25N NaOH are added to each and desorbed for a minimum of one hour [10:30 – 11:30] with occasional agitation. Then an aliquot of each front section and back section is filtered with a 0.45µm PES membrane filter prior to analysis on a SmartChem Discrete AA (WET01).

In variation to the method; 0.25N NaOH is used instead of water to stabilize the cyanide, and 20mL is used instead of 10mL to allow for complete desorption.

REAGENTS: 0.25 N NaOH 06/13/13 MNK Horizon # 19536

ICV is 0.200mL of Int. Check Int. [19546] brought to 50mL with 0.25N NaOH = 200µg/L.

INSTRUMENT PARAMETERS: See instrument printout for operating parameters.
Plan #: 20130613002.

CONVERSIONS/CALCULATIONS:

Conversion: (MW, HCN) 27.026 / (MW, CN) 26.018 = 1.039

HCN: µg CN/L x 0.020 L/sample x 1.039 HCN = 0.02078 [conversion factor (CF) = 0.02078]

QC CN: µg CN/L x 0.020 L/sample = 0.02 [conversion factor (CF) = 0.02]

REPORTING LIMIT:

(HCN) RL: 10.0 µg/L (low standard) x 0.02078 = 0.2078 = 0.21 µgHCN/sample

DILUTIONS: None.

COMMENTS: QC's are reported as µg CN/sample; results are not converted to HCN.

(HCN) Media is Soda Lime Tube, SKC Cat.No.226-28, Lot 7542 ex. Apr. /2017.

LCS/LCSD: 0.04 mL/20 mL x 0.02 x 50,000 µg/L [19546] = 2 µg CN/sample .

Field sample media WO 1315667 Lot 8238 SKC 226-28 exp. Dec/2017.

Prep Start Time:	11:50

Method Information

QC and sample hopcalite materials are transferred into digestion vessels. (Blank tubes are always used for hopcalite QC material)

Hopcalite QC matrix:	Lot ID: Carulite (HYDRAP)
MB, LCS, LCSD, RLVS	78835KC Exp May/2017

10 mL of ASTM Type II H₂O is added to digestion vessels for standards and RB (all digestion vessels that do not contain hopcalite material). Mercury Standards and QCs spiked as indicated. [Hg] in µg/sample. LCS, LCSD, and RLVS are spiked on hopcalite QC material.

x2 [

2.5 mL HNO₃ and then 2.5 mL HCl is added to each vessel. Allow QCs and samples to digest until completely dissolved (about one hour).

HNO ₃	Lot: 52088	Manufacturer: EMD
HCl	Lot: 52250	Manufacturer: EMD
Start Time:	13:46	End Time: 14:46

Dilute all standards QCs and samples to final volume of 50 mL with ASTM Type II H₂O. Cap tightly and shake to mix. Since the final volumes of the instrument calibration standards and all the QCs and samples are the same, the targets of the instrument calibration standards are entered into the method in ug/sample. Therefore all results are given in ug/sample.
