Neck Heat Extraction System Monthly Report November 2016 *Bridgeton Landfill, LLC*

1	INTRODUCTION.....	1
2	NECK HEAT EXTRACTION SYSTEM OPERATION.....	1
3	METHOD OF CALCULATION OF HEAT REMOVAL.....	2
4	SUMMARY AND DISCUSSION OF RESULTS	4

TABLE 1 – Period 11-01-2016 to 11-30-2016 Calculated Heat Energy Removal

APPENDICES

Appendix A – Temperature Monitor Probe Graphs (November 2016)

Appendix B – Heat Removal Point Measurement Results (November 2016)

Attachment 1 – GIW Locations Raw Temperature Measurement Results Provided by Instrumentation

Attachment 2 – HEW Locations Raw Temperature Measurement Results Provided by Instrumentation

Attachment 3 – GIW Locations Field-Measured Temperature and Flow Results

Attachment 4 – HEW Locations Field-Measured Temperature and Flow Results

Appendix C – Neck Heat Extraction System Plan View

1 INTRODUCTION

This document is being submitted as the November 2016 monthly update for the Neck Heat Extraction System, covering the period of November 1st through November 30th, 2016. Construction of the system was completed on September 25, 2016 and operation of the full system began on October 11, 2016. The system was installed per Section VIII.35.c of the April 28, 2016 Administrative Settlement Agreement and Order on Consent for Removal Actions (ASAOC), which incorporated the November 2015 *Technical Evaluation of a Heat Extraction Barrier*, prepared by Feezor Engineering, Inc. (FEI) and an approval letter dated December 4, 2015 from the Missouri Department of Natural Resources (MDNR). As stated in Comment No. 8 of the December 4, 2015 MDNR letter, system status summary reports are required to be submitted monthly on the 20th of each month. Accordingly, monthly reports will continue to be submitted on the 20th of each month, or the first business day following the 20th, if the 20th falls on a weekend or holiday.

This monthly update provides a presentation of in-waste temperature measurements, heat removal results for each removal location, status of the current heat removal system, and a discussion of measurement results. A tabular presentation of calculated quantities of heat (energy) removed is provided in **Table 1**. Graphical presentations of temperature data collected from in-place waste System Performance Monitoring Temperature Monitoring Probes (SPM TMPs) are presented in **Appendix A**. Raw temperature measurement results (provided by data collection instrumentation) and field-measured temperature and flow measurement results are provided in **Appendix B**. A plan view of the TMP locations and Neck Heat Extraction System is provided in **Appendix C**.

2 NECK HEAT EXTRACTION SYSTEM OPERATION

The Neck Heat Extraction System consists of the heat extraction elements in the Gas Interceptor Wells (GIW-2, GIW-3, GIW-4, GIW-5, GIW-6, GIW-7, GIW-8, GIW-9, GIW-10, GIW-11, GIW-12, and GIW-13) and the Heat Extraction Wells (HEW-1, HEW-2, HEW-3, HEW-4, HEW-5, HEW-6, HEW-7, HEW-8, HEW-9, HEW-10, HEW-11, HEW-12, HEW-13, HEW-14, HEW-15, and HEW-16). The GIW units were installed in 2014 and were operated as part of a heat extraction pilot study. The HEW units were installed in 2016. The twenty-eight (28) heat extraction units, the cooling tower, the cooling liquid storage tank, the pump, and the instrumentation system comprise the Neck Heat Extraction System.

The GIW system has been removing heat since November 2014 and remained in operation during the installation of the HEW elements. The HEW system and four (4) System Performance Monitoring (SPM) Temperature Monitoring Probes (TMPs) were previously completed on September 25, 2016. Operation of the HEW system began on October 11, 2016.

Operation and Maintenance (O&M) activities performed during November 2016 included:

- Automatic data collection instrumentation was installed at GIW and HEW locations and subsequently activated;
- Automatic data collection instrumentation elements were connected to a centralized chart recorder;
- Weekly adjustments were performed at individual HEW and GIW locations to maintain a six (6) gallon per minute flow rate at each location;
- The tank containing the closed loop cooling water circulating in the GIW and HEW locations was drained and refilled on November 17, 2016; and
- The closed loop cooling fluid circulating in the GIW and HEW locations was switched from water to a glycol/water mixture on November 30, 2016.

3 METHOD OF CALCULATION OF HEAT REMOVAL

The energy removed from the landfill via the extraction points (both the HEW and GIW units) occurs through the passing of liquid through each extractor that emerges warmer than it was when it entered the extractor. During November 2016, the fluid being circulated was water. The rate of energy removal is equal to the mass of water per given time passing through the extractor times the heat capacity of the water times the change in temperature that occurred as it passed through the extractor, and is expressed in Equation 1:

$$HRR = C_p \times Q \times \delta \times (T_o - T_i) \quad (1)$$

Where:

HRR = Heat Removal Rate (kilowatts)

C_p = Heat Capacity of Water (4.182 joule/(gm - °K))

Q = Flow Rate (gpm)

δ = Mass Density of Water (990 kg/m³)

T_o = Outflow Temperature (degrees F)

T_i = Inflow Temperature (degrees F)

Equation 1 simplifies to:

$$HRR = 0.114 Q(T_o - T_i) \quad (2)$$

Equation 1 assumes the density and heat capacity of water are constant. This assumption is acceptable given the rather narrow range of temperature of the liquid and the pressure.

The amount of heat energy removed at a given extraction point is equal to the heat removal rate (HRC) multiplied by time. For points that are fully instrumented, this could be the summation of HRC multiplied by time for each recorded interval.

Readings at the site for November 2016 along the Neck Heat Extraction System are provided in **Appendix B** and can be divided into two (2) periods. The initial period consists of 12 AM on November 1st through 9:30 AM on November 18th. Readings of flow, inlet temperature, and outlet temperature on HEW and GIW units were obtained manually at varying intervals. During the initial period, flow rates and incoming temperatures were read via flow meters on the incoming flow side. The temperatures on the outflow side were read manually via the scrolling of the wireless receiver units that were installed, but not yet recording, for most of the units. Exceptions to this were units HEW 1, 2, and 3 and GIW units 7 and 9, which required a stronger antenna setup in order to be read. The second period, extending from 9:30 AM on November 18th through the end of the month (12 AM on December 1st, 2016). During the second period, data on incoming temperatures and outgoing temperatures were monitored at ten (10) minute intervals and recorded using the wireless Resistance Temperature Detector (RTD) system. Flow readings were obtained manually using the meters on the incoming flow line per unit.

Calculations for extraction rate (HRR) during the initial period were made for each observed combination of flow rate, incoming temperature, and outgoing temperature. The extraction rate was determined as determined using Equation 1 provided above. The amount of energy extracted (HR) for the period between two (2) times (t_1 and t_2) was computed by multiplying the elapsed time by the average rate of extraction between the two (2) recorded times as expressed in Equation 2:

$$HR_{t_2-t_1} = 0.5 \times (HRR_{t_1} + HRR_{t_2}) \times (t_2 - t_1) \quad (2)$$

The calculation for heat removal rate and total heat removal for the period following 9:30 AM on November 18th, 2016 was performed in the same fashion except that:

- Inlet temperatures were assigned based on the wireless RTD temperature readings on HEW 5 and GIW 5, recorded at ten (10) minute intervals;
- Outlet temperatures were assigned based on the wireless RTD temperature readings at each unit, obtained at ten (10) minute intervals;
- Flow rate values were based on manual readings of flow at discrete times, linearly interpolated to each ten (10) minute time interval; and
- The calculated heat removed was not averaged for the time step, but was calculated for the time period based on the HRR for the time recorded x 10 minutes (10/60 hr)

Where flow outages existed (November 30, 2016), zero (0) flow times were assigned on the basis of the noted time of the shutdown.

Utilizing the calculation methodology presented above, the total energy (heat) quantities removed for each unit over the reporting period are presented in **Table 1**.

4 SUMMARY AND DISCUSSION OF RESULTS

The Bridgeton Landfill successfully operated sixteen (16) heat extraction wells during November 2016. These sixteen (16) HEWs previously commenced operation during October 2016. The Bridgeton Landfill also successfully operated twelve (12) GIW units during November 2016. Based upon the energy (heat) removal results provided in **Table 1**, the total amount of energy (heat) removed from the neck heat extraction system for the month of November 2016 was over 340 million British Thermal Units (BTUs).

Bridgeton Landfill will continue to operate the Neck Heat Extraction System. The next heat extraction monthly report will be submitted by Friday, January 20, 2017.

TABLE 1**Period 11-01-2016 to 11-30-2016****Calculated Heat Energy Removal**

Unit	kW-hr
HEB-1	1,523
